Magnetic Resonance Imaging (MRI)

Magnetic Resonance Imaging (MRI) is a way of examining the inside of the body. The MRI machine is a large magnet that surrounds the body. It uses magnetic fields and radio frequencies instead of X-rays to produce images. Your child is not exposed to radiation during this exam.

**What to bring for the test**

Have your child bring a favorite toy or blanket to keep with him or her during the test. (The toy may not have any metal in or on it.)

**Before the test**

- **Clothing** - Dress your child in comfortable clothes that will be easy to remove. For safety, children are asked to change out of their clothes and into clothes the hospital will give you (like hospital gowns, pants and shorts). Anything that contains metal (such as hairpins, watches or jewelry) or any body piercing must be removed. Metal can affect the test. Tell the technologist if your child has any tattoos or uses a medicine patch.

| Child’s name: ______________________ |
| APPOINTMENT DATE: _________________ |

Please bring your child to:

- Nationwide Children’s Hospital Main Campus, First Floor, Crossroads Registration Area, 700 Children’s Drive, Columbus, OH. Phone: (614) 722-2351, Option #2.
- Nationwide Children’s Hospital, Westerville Close-to Home Center, Registration Desk 433 N. Cleveland Ave., Westerville, OH Phone: (614) 355-8300

A parent or guardian must be present at registration if a child is under 18 years old.

**ARRIVAL TIME:**

- If your child **needs anesthesia**, you will get a phone call from a nurse in the procedure center the day before the exam, to give you instructions about when and where to arrive, and when your child should stop eating and drinking.
- If your child **does not need anesthesia**, we need you to arrive **30 to 45 minutes before your scan time**. This allows you time to register and fill out safety screening sheets.

**Scan time: ______________________**

If you need to cancel or reschedule your child’s appointment, call (614) 722-6200, Radiology option.
• **Medicines** - On the day of the MRI scan, the child should NOT take medicine only meant to calm worries about the MRI or make him or her sleepy for the exam. Please call the Radiology nurses with questions at (614) 722-2624.

• **Prescription medicines** - Give your child his or her other usual prescription medicines.

• If your child uses a medicine patch, remove the patch before the test. Put the sticky sides together, and flush it down the toilet. If there is any gel on the skin, wipe it off before going into the MRI. After the test, replace the patch with a new one.

**How the test is done**

If your child is **not having** anesthesia, one parent may stay with him or her in the MRI room while the test is being done. If you would like to stay with your child during the test, please tell the technologist.

A technologist or nurse will take you and your child from the waiting room to the MRI area.

**For the safety of both you and your child:**

• All metal and jewelry must be removed before entering the MRI area. You will have a locker to secure your property.

• The technologist will take you and your child through a metal detector and into the MRI room.

• Next, the technologist will have your child lie on the MRI table. The technologist will move the table so that the child's body is inside the opening of the machine where the magnet is (Picture 1). If your child is not having anesthesia, it is important for him or her to know to hold very still during the test. If a child moves too much, it may take longer to finish the test and complete a readable scan or the test may need to be rescheduled. Sometimes, a form of “sleepy medicine” is needed to complete the test. If the MRI exam is not scheduled with anesthesia, this may mean coming back on a different day.

• Your child will be given earplugs to wear or a set of headphones to listen to music. Your child will not have any pain with this test, but will hear a sound like a loud tapping or hammering. During some tests, your child might also be able to watch a movie. The technologist will let you know if this is possible.

• Your child’s doctor may ask that the child be given a contrast solution during the test so the scan can pick up more information. If so, an IV will be started and the contrast
solution will be put in the IV. The technologist will be outside the room during the test but will be able to see and hear your child. Depending on the type of test your child is having, the exam may take 20 to 90 minutes to complete.

After the test

- If an IV was placed for contrast solution, it will be removed after the test is finished.
- A report of the test results will be sent to your child’s doctor. When the doctor gets the results, he or she will explain the test to you.

If you have any questions, ask your child’s doctor, nurse or technologist, or call 614-722-6200.
