Endocrinology

Inclusion & Exclusion Criteria

Inclusion Criteria for DKA (moderate risk for cerebral edema, requiring intravenous fluids and insulin drip)

- Age 12 months 21 years
- Blood glucose ≥ 200-600 mg/dL
- Ketosis (β -OH-Butyrate \geq 3 mmol/L or moderate urinary ketones \geq 40)
- Venous pH <7.2 or serum bicarbonate < 15 mEq/L

Inclusion Criteria for Hyperosmolar-DKA (moderate-high risk for cerebral edema, requiring intravenous fluids and insulin drip)

- Age 12 months 21 years
- Blood glucose > 600 mg/dL
- Ketosis (β -OH-Butyrate \geq 3 mmol/L or moderate urinary ketones \geq 40)
- Venous pH <7.2 or serum bicarbonate < 15 mEq/L
- Serum osmolality > 320 mOsm/kg

*Criteria apply when conditions met at any time during referring facility stay or NCH.

If patients has signs of DKA but does not meet inclusion criteria, off pathway but discuss with Endocrinology Team.

Exclusion Criteria

- Inclusion criteria not met (see Sick Day Protocol for patients deemed to be low risk and contact Endocrinology)
- Hyperglycemic Hyperosmolar State (HHS) must meet all

Blood glucose > 600 mg/dL Venous pH > 7.35 Serum bicarbonate \ge 15 mEq/L Absent to small urine ketones Serum osmolality > 320 mmol/kg

Initial Assessment

- Airway, Breathing & Circulation (A,B,C's)
- Vital signs
- Hydration status
- Presence of signs of increased intracranial pressure: Pupil asymmetry
 - ↑ blood pressure
 - ↓ heart rate
- Assess for shock as part of circulation assessment

Normal Respiratory Rates			
Age	Rate (breaths per		
	minute)		
Infant	30-53		
Toddler	22-37		
Preschooler	20-28		
School-age	18-25		
Adolescent	12-20

Assessment of Dehydration

Cerebral Edema

Signs and Symptoms	Degree of Dehydration			
	None or Mild	Moderate	Severe	
General Condition				
Infants	Thirsty, alert, restless	Lethargic or drowsy	Limp; cold cyanotic extremities; may be comatose	
Children	Thirsty, alert, restless	Alert; postural dizziness	Apprehensive; cold, cyanotic extremities; muscle cramps	
Quality of radial pulse	Normal	Thready or weak	Feeble or impalpable	
Quality of respiration	Normal	Deep	Deep and rapid	
Skin elasticity	Pinch retracts immediately	Pinch retracts slowly	Pinch retracts very slowly (> 2 sec)	
Eyes	Normal	Sunken	Very sunken	
Tears	Present	Absent	Absent	
Mucous membranes	Moist	Dry	Very dry	
Urine output (parental	Normal	Reduced	None passed in	
report)			many hours	
Adapted from Gorelik MH, Shaw KN, Murphy KO. Validity and reliability of clinical signs in the diagnosis of dehydration in children. Pediatrics. 1995;99(5):1-6				

Differential Diagnosis

- Hyperglycemic Hyperosmolar State (HHS)*
- Lactic Acidosis
- Starvation Ketosis
- Alcoholic Ketoacidosis
- Uremic Acidosis
- Toxic Ingestion

*HHS Laboratory Definition (Must have all)

- Serum glucose > 600 mg/dL
- Absent to small urine ketones
- Serum osmolality > 320 mmol/kg
- Venous pH > 7.35
- Serum carbon dioxide \geq 15 mEq/L

For Comparison, Moderate-Severe DKA and Hyperosmolar DKA				
DKA (moderate-severe)	Hyperosmolar DKA			
 Blood glucose ≥ 200-600 mg/dL Ketosis (β-OH-Butyrate ≥ 3 mmol/L) Moderate urinary ketones (≥40+) Venous pH <7.2 Serum bicarbonate < 15 mEq/L 	 Blood glucose > 600 mg/dL Ketosis (β-OH-Butyrate ≥ 3 mmol/L) Moderate urinary ketones (≥40+) Venous pH <7.2 Serum bicarbonate < 15 mEq/L Serum osmolality > 320 mOsm/kg 			

Severity Assessment for Risk of Developing Cerebral Edema & Recommended Disposition

Low Risk Criteria

- pH ≥7.2
- serum carbon dioxide ≥15 mEq/L
- Able to tolerate oral fluids.
- Decreasing ketonuria (management initiated at home with sick day protocol)

Disposition*

Able to manage mild acidosis at home (per sick day protocol) if knowledgeable caregiver and able to easily return to main campus, if needed. Call Endocrinology on call provider to discuss disposition to admit versus discharge home.

*All patients with suspected New Onset Diabetes Mellitus should be admitted to the endocrinology service.

Medium Risk Criteria

- Not meeting low or high risk criteria
- Progression of ketonuria precluding home management
- Unable to tolerate oral challenge even in mild DKA
- Presence of unstable social situation

Disposition

Admit to Endocrinology Service for IV insulin therapy after discussion with on call Endocrinology Provider.

High Risk Criteria

- Lowest pH < 7.1 age < 3 years
- Lowest pH < 7.0 age \geq 3 years
- Blood glucose > 600 mg/dL
- Corrected Serum Sodium > 155 mEq/L
- New onset neurological deficit
- Clinical or radiographic concerns for cerebral edema

Disposition

Consider pediatric intensive care unit (PICU) for IV insulin therapy and ongoing monitoring. Strongly consider PICU admission based on labs at initial presentation.

Cerebral Edema

Risk Factors for Cerebral Edema

- Age < 3 years
- Administration of bicarbonate
- Low PaCO2 levels at presentation
- Excessive fluid resuscitation (≥ 40 mL/kg bolus)

Clinical Signs of Cerebral Edema

- Concerning or deteriorating mental status
- Headache
- Abnormal pupils
- Bradycardia or lower heart rate than expected for degree of dehydration*
- Hypertension*
- Altered breathing pattern (grunting, Cheyne-Stokes, apneusis)*

*When seen together are late signs and concerning for herniation

Management of Suspected or Confirmed Cerebral Edema

1) Administer:

3% hypertonic saline (5 mL/kg/dose)

or

Mannitol (1 g/kg/dose) Beware of diuresis in severely dehydrated patient.

2) Elevate head of bed

3) Discuss indications for CT scan with PICU (administer mannitol or hypertonic saline PRIOR)

Electrolyte Management

Sodium (Na⁺)			
Corrected sodium calculation Measured Na + 1.6 (serum glucose – 100)/100	Useful for monitoring response to fluid therapy during DKA when hyperglycemia exists (glucose >100 mg/dL)		
For corrected Na ⁺ < 140 mEq/L	Maintenance fluid containing Normal Saline should be used if not started prior		
For corrected Na ⁺ < 125 mEq/L	Consider 3% Sodium Chloride		
Potassium (K⁺)			
 For potassium < 3.0, give KCL 0.2-1 mEq/kg/dose (max 40 mEq) during initial fluid resuscitation. Recheck potassium level via poc blood gas to ensure ≥ 3.0 <i>prior to stating insulin drip</i> Include K⁺ in continuous IV fluids at the time of initiation, unless true hyperkalemia (> 6 mmol/L) exists 			

• Adequate urine output should be demonstrated prior to initiating K⁺ replacement

For K ⁺ replacement, administer as <u>KPho</u>	If <u>KPhos</u> unavailable, use K ⁺ acetate	
Suggested potassium components for cc		
<u>Serum K⁺</u>	<u>KPhos (mEq/L)</u>	<u>KCL⁻ (mEq/L)</u>
<4.5	30	30
4.5-6	20	20
>6	None	

For hyper or hypokalemia, have patient on continuous ECG monitoring

For hyperkalemia, please refer to the ED Hyperkalemia Clinical Pathway

Calcium (Ca⁺⁺), Phosphorous (PO₄³⁻)

Closely observe calcium levels with KPhos administration since hypocalcemia may be induced

Treat severe hypophosphatemia (Phos <1mg/dl)	Important especially if this is accompanied by clinical features (muscle weakness, cardiac dysfunction specifically, left ventricular dysfunction, symptomatic anemia, or respiratory depression)

Bicarbonate (HCO3⁻)

Avoid routine HCO3⁻ administration since paradoxical CNS acidosis may develop & hypokalemia may be precipitated

In life threatening hyperkalemia bicarbonate therapy may be administered

Recommended Treatments for Medium or High Risk Patients

Intravenous Fluid (IVF) Administration & IV Insulin Phase Fluid administration and IV insulin therapy occurs simultaneously

IVF administration:

• 1.5 X maintenance rate

For potassium < 3.0, give KCL 0.2-1 mEq/kg/dose (max 40 mEq) during initial fluid resuscitation. Recheck potassium level via POC blood gas to ensure ≥ 3.0 *prior to starting insulin drip*

Two-Bag system:

- 10% Dextrose in NS
- NS

- Calculation of maintenance IVF by 4, 2, 1 rule:
- 4 mL/kg/hour for first 10 kg
- 2 mL/kg/hour for second 10 kg mL/kg
- 1mL/kg/1mL/kg/hour for each kg over 20kg

Insulin drip:

- Children ≤ 5 years of age or initial BG > 1000 mg/dL start insulin at rate of 0.05 unit/kg/hour
- Children > 5 years of age start insulin drip at rate of 0.1 unit/kg/hour
- Aim to maintain BG between 120-200 mg/dL while patient is receiving insulin drip

Adjust IVF composition based on BG:

- If BG decreases by more than 100 mg/dL in an hour, increase dextrose in IVF to higher concentration. If already on 10%, increase to 12.5%
- If BG is < 100 mg/dL, increase total IVF to 2 X maintenance or discontinue two-bag system and give dextrose 12.5% with same electrolyte content
- Recheck BG in 30 minutes after a change in IVF dextrose or adjustment of IV insulin

Suggested potassium components for continuous IV fluids:

<u>Serum K⁺</u>	<u>KPhos (mEg/L)</u>	KCL ⁻ (mEq/L)
<4.5	30	30
4.5-6	20	20
>6	None	None

Blood glucose	10 % Dextrose NS	Final dextrose	Normal Saline
(mg/ai)	% of total IV fluids	concentration	% of total IV fluids
> 300	0	0	100
200- 300	50	5 %	50
101- 199	100	10 %	0

Treatments Not Recommended

Bicarbonate therapy should not be used in children with DKA

- Lack of clinical benefit
- Paradoxical central nervous system acidosis
- Associated with development of cerebral injury
- May slow the resolution of ketosis

Insulin bolus is not indicated

- No clinical benefit
- May increase risk of cerebral edema
- May lead to hypoglycemia

<u>Algorithm</u>

PICU Admission Criteria

PICU admission for any of the following:

- New onset neurologic deficit
- Concern for cerebral edema

Strongly consider PICU admission

- pH < 7.1 for age < 3 years old
- pH < 7.0 for age ≥ 3 years old
- Initial blood glucose > 1000 mg/dL
- Corrected serum sodium > 155 mEq/L

Quality Measures

Process Metrics:

- Pathway visualization
- Utilization of Epic Order Set
- Blood glucose obtained within 30 minutes prior to departure from ED

Outcome Metrics:

- Zero incidence of hypoglycemia (BG<60) during ED care
- Emergency Department length of stay

Balancing Measures:

- Rate of inpatient transfer to the PICU within 6 hours of admission
- Return to Emergency Department/Urgent Care for diabetes related concern within 72 hours

Clinical Pathway Development

This clinical pathway was developed using the process described in the NCH Clinical Pathway Development Manual Version 6, 2022. Clinical Pathways at Nationwide Children's Hospital (NCH) are standards which provide general guidance to clinicians. Patient choice, clinician judgment, and other relevant factors in diagnosing and treating patients remain central to the selection of diagnostic tests and therapy. The ordering provider assumes all risks associates with care decisions. NCH assumes no responsibility for any adverse consequences, errors, or omissions that may arise from the use or reliance on these guidelines. NCH's clinical pathways are reviewed periodically for consistency with new evidence; however, new developments may not be represented, and NCH makes no guarantees, representations, or warranties with respect to the information provided in this clinical pathway.
